

What is claimed is:

Sub
A87

1. An ink container to be received within a receiving station of an inkjet printing system, the receiving station having a fluid inlet having a compliant seal and a pair of 5 guide slots extending along either side of the fluid inlet, the ink container comprising:
 - a guide feature outwardly extending therefrom, the guide feature disposed toward a trailing end relative to an insertion direction; and
 - wherein the guide feature is configured to cooperate with the at least one guide slot to guide the ink container in a pivot motion to ensure the ink10 container engages the compliant seal forming a seal therewith.
2. The ink container of claim 1 wherein the guide feature is a pair of guide features that each extend outwardly from an ink container housing.
- 15 3. The ink container of claim 2 wherein the ink container housing defines a fluid outlet in a bottom portion thereof relative to a gravitational frame of reference.
4. The ink container of claim 2 wherein the ink container housing defines a leading end and a trailing end relative to an insertion direction and a pair of sidewalls 20 each extending between the leading and trailing ends and wherein the pair of guide features each extend outwardly from each of the pair of sidewalls.
- 25 5. The ink container of claim 1 further including a second guide feature outwardly extending therefrom, the second guide feature disposed toward a leading end relative to an insertion direction into the printing system.
- 30 6. The ink container of claim 1 wherein the ink container has leading end and a trailing end are disposed on a central axis along a major axis of the ink container and the pair of sidewalls are disposed on a central axis along a minor axis of the ink container and wherein the guide features are a pair of guide features are disposed

Conf

toward the leading end of the central axis and extending outwardly along the minor axis.

7. The ink container of claim 1 wherein the receiving station includes
5 a guide slot and wherein the guide feature is configured to engage the guide slot to
guide the ink container in a pivot motion so that the ink container engages a
compliant seal on the inkjet printing system.

8. An ink container for insertion into an inkjet printing system, the ink container
10 comprising:

an ink container housing defining a leading end and a trailing end
relative to an insertion direction and a pair of sidewalls each extending between the
leading and trailing ends;

15 a first pair of guide features, each of the first pair extending outwardly
from each of the pair of sidewalls; and
a second pair of guide features, each of the second pair extending
outwardly from each of the pair of sidewalls.

9. The ink container of claim 8 wherein the leading end and a trailing end are
20 disposed on a central axis along a major axis of the ink container and the pair of
sidewalls are disposed on a central axis along a minor axis of the ink container and
wherein the first pair of guide features are disposed toward the leading end of the
central axis along the minor axis and the second pair of guide features are disposed
toward the trailing end of the central axis along the minor axis.

25 10. The ink container of claim 8 wherein the ink container housing defines a fluid
outlet in a bottom portion thereof relative to a gravitational frame of reference.

30 11. The ink container of claim 8 further including an engagement feature disposed
on the leading edge, the engagement feature configured to engage corresponding
engagement features associated with the receiving station.

cont

12. The ink container of claim 11 wherein the inkjet printing system includes a guide slot and wherein the second pair of guide features is configured to engage the at least one guide slot to guide the ink container in a pivot motion so that the ink container engages a compliant seal on the inkjet printing system.

5

13. The ink container of claim 11 wherein the inkjet printing system includes a guide rail and wherein the first pair of guide features is configured to engage the guide rail to guide the ink container into the inkjet printing system.

10

14. The ink container of claim 11 wherein the inkjet printing system includes an engagement feature configured to engage corresponding engagement features associated with the ink container.

15. 15. A replaceable ink container for providing ink to an inkjet printing system, the receiving station having a fluid inlet having a compliant seal and a pair of guide slots extending along either side of the fluid inlet, an engagement feature disposed on the leading edge, the engagement feature configured to engage corresponding engagement features associated with the receiving station the replaceable ink container comprising:

20

a fluid outlet configured for connection to the fluid inlet associated with the receiving station; and

25

a guide slot engagement feature disposed toward a trailing end of the replaceable ink container relative to an insertion direction, wherein with an engagement feature disposed on a leading edge engaged with corresponding engagement features associated with the receiving station and with the guide slot engagement feature is so disposed and arranged on the replaceable ink container to interact with at least one of the pair of guide slots to guide the replaceable ink container into the receiving station to align the fluid outlet with the fluid inlet and to

30

engage the compliant seal to establish a seal between the replaceable ink container and compliant seal.

16.1 The replaceable ink container of claim 15 wherein the inkjet printing system includes a guide rail and wherein the replaceable ink container further includes a second pair of guide features that are configured to engage the guide rail to guide the 5 ink container into the inkjet printing system.

17. A method for inserting a replaceable ink container into a receiving station of an inkjet printing system, the receiving station disposed on a scanning carriage and fluidically coupled to an ink ejection portion mounted thereon, the method for 10 inserting the ink container comprising:

engaging an engagement feature on a leading edge of the replaceable ink container with a corresponding engagement features associated with the receiving station;

15 engaging a pair of outwardly extending guide features disposed toward a trailing end of the ink container; and

urging the ink container toward the receiving station wherein each of the pair 20 of guide features guide the replaceable ink container along an arc about a pivot axis toward a bottom surface of the receiving station to align a fluid outlet on the replaceable ink container with a compliant sealing structure about a fluid inlet to form a seal with the fluid outlet.

18. The method of claim 17 wherein prior to engaging an engagement feature on a leading edge, the method including:

25 engaging a pair of outwardly extending guide rail engagement features on the toward the leading edge of the ink container with each of a pair of guide rails on the receiving station; and

urging the ink container toward the receiving station wherein each of the pair 30 of guide rails guide the replaceable ink container linearly toward a back wall of the receiving station to align the engagement feature with the corresponding engagement features.
